

Employee Attrition Prediction – Executive Summary

Prepared by: Amit Kumar Singh

This project analyzed employee data to identify patterns that may indicate whether an employee is likely to leave the company. The objective was to help the Human Resources (HR) team better understand employee turnover and support proactive retention efforts before valuable employees resign.

Employee records were cleaned and analyzed using factors such as department, job role, monthly income, work-life balance, years at the company, overtime, and job satisfaction. Visual analysis was performed to identify trends associated with employee attrition.

The analysis found that the overall attrition rate was approximately **[replace with your value]%**. The **[Department]** department experienced the highest employee turnover, while the **[Job Role]** position showed the highest likelihood of employees leaving. Most resignations occurred within the first **[Years]** years of employment, suggesting that employees are more likely to leave during the early stages of their careers.

The findings indicate that employee attrition is influenced by multiple workplace factors rather than salary alone. Lower job satisfaction, poor work-life balance, overtime, and shorter tenure were all associated with a greater likelihood of leaving the company.

Based on these findings, HR should prioritize retention efforts in high-risk departments and job roles, provide mentoring and career development opportunities for newer employees, encourage regular employee feedback, and strengthen work-life balance initiatives. These actions can help reduce turnover and improve employee satisfaction.

Although this analysis provides valuable insights, it cannot capture personal circumstances such as relocation, family responsibilities, health issues, or external job opportunities. Therefore, the predictions should support HR decision-making rather than replace professional judgment.

Overall, this project demonstrates how data-driven insights can help HR teams make informed decisions, improve employee retention, reduce recruitment costs, and build a more stable workforce.
